

1. What can types be used for?
 - a. **Catch errors in the program early at compile time.**
 - c. **Help categorize the key concepts of programs into meaningful groups.**
 - d. **Enable polymorphic functions.**
2. Which are must-have components of a type system?
 - a. **Basic types and their built-in operators.**
 - b. **Compound types, their constructors, and operations to extract their values.**
 - c. **Ways to determine whether two types are the same.**
 - e. **Ways to check whether each operation is applied to the correct types.**
3. What is the difference between transparent and opaque type declaration?
 - a. **A transparent declaration introduces a synonym for an existing type; an opaque one introduces a new compound type that didn't exist before.**
4. Which of the following is NOT an example of type errors?
 - c. **Null pointer dereference.**
5. Which of the following type errors can be caught at compile time?
 - a. **Adding an integer with a string.**
 - b. **An array being accessed out-of-bounds.**
 - d. **A value being casted to an unrelated type.**
 - e. **Dividing a value by zero.**
6. Map the components to the information they store.
Runtime stack – dynamically allocated memory
Heap – values of variables
Code space – instructions of the program
Code pointer – the next statement to evaluate
7. Which of the following is NOT a block?
 - e. **$x = x + 2$; $y = y + 2$;**
8. What value should be returned for the following ML code if static scoping is used? What value should be returned if dynamic scoping is used?
let val x = 3
 in let fun foo(y) = x * y
 in let val x = 5 in foo(5)
 end
 end
 end;
Static scoping: 15
Dynamic scoping: 25

9. What is the result of the following pseudocode when each of the parameter passing mechanisms, pass-by-name, pass-by-value, and pass-by-reference, is used?

```
int f (int x) {
    x:= x+1; return x;
};
main() {
    int y = 0;
    print f(y)+y;
}
```

Pass-by-name: $f(y) \rightarrow y:=y+1 \rightarrow (y+1) + y \rightarrow 1$

Pass-by-value: $f(0) \rightarrow x:=0+1 \rightarrow 1 \rightarrow 1 + 0 \rightarrow 1$

Pass-by-reference: $f([ref]y) \rightarrow y:=0+1 \rightarrow 1 + 1 \rightarrow 2$

10. Draw a pictorial snapshot of the run-time stack memory for the following ML code.

```
val x = 1;
fun g(z) = x+z;
fun h(z) =
    let
        x = 2
    in
        g(z)
    end;
h(3);
```
